Securityhunter joins Boeing security product distributor team

BALTIMORE, MD, May 3, 2010 - Securityhunter was recently named a distributor of Boeing's Visual Security Operations Console (VSOC) Sentinel security management product. As a distributor, Securityhunter is responsible for identifying potential customers, demonstrating the VSOC Sentinel product and ultimately finalizing sales of the product. Securityhunter will also have the opportunity to explore synergies between Securityhunter's products and the Boeing-developed security solution.

"Being selected to offer Boeing's VSOC system to our clients will help our company to protect our nation - our primary mission here at Securityhunter," said Michael Rogers, CEO of Securityhunter. "We are excited to offer this sophisticated and innovative new technology from Boeing, a security industry leader."

VSOC Sentinel is a software common operating environment that integrates different security systems and information technology resources to analyze and assess enterprise-level security threats and coordinate rapid response. It uses high-resolution 3D modeling and 2D mapping for a realistic operational view of a site's critical infrastructure while monitoring user-defined alerts and alarms. The result is the capability to recognize a threat in real time and to immediately respond to security requirements and to protect commercial, civil, or military assets.

Securityhunter has extensive experience in assessing and providing for the physical security needs of government, military and commercial clients. For more information on Securityhunter, visit <http://www.securityhunter.com>.

VSOC Sentinel is part of Boeing's Global Security Systems. Additional information is available at <http://www.BoeingVSOC.com>.
